# idenprotect

Password-Free Multi-Factor Authentication

Thanks to digital transformation, identity is becoming the new business perimeter. idenprotect's password-free multi-factor authentication (MFA) is the tool you need to make that perimeter strong.

Better than all the rest

idenprotect's password-free MFA gives your security new and unshakeable underpinnings. It makes logging in to corporate applications and systems easier than ever before and eliminates the risks associated with passwords, shared secrets and 2-factor authentication (2FA). The ultimate result: your systems and data are safer, and life's a little easier for all staff at all levels, wherever they may be.

SIMPLE TO USE
No passwords to enter, remember or forget

FAST TO DEPLOY
Nothing physical to roll out

THE SAFER OPTION
Safer than solutions that use passwords and pre-shared keys

What do you get with idenprotect's MFA?

Public Key Protection
idenprotect eliminates shared secrets by creating two keys: one public, one private. The server has the public key and no one but the user has the private key.

Decentralised Security
Unlike centrally stored passwords and pre-shared keys, each user's private key is stored in their mobile device, which means there's no single store of secrets for hackers to find.

Impregnability
By storing the user's private key in the secure chip in their mobile device, we render it inaccessible to hackers and malware, adding an extra-strong layer of protection.

Increased Efficiency & Productivity
With no passwords to enter, manage or reset, users and IT teams have more time for the work that counts.

Interoperability
idenprotect can be integrated with modern and legacy applications, Windows desktops and laptops and single sign-on (SSO) systems—including our own SSO solution.

Legal Systems Modernisation
idenprotect's access gateway enables password-free access to legacy applications without any alterations to the apps themselves.

Benefits across the organisation

Senior management
can have confidence that the risk of security breaches and the consequent financial and reputational damage has been dramatically reduced.

IT and security professionals
can save time and money and increase their own productivity while protecting the business.

End users
can work faster and smarter, where they want and how they want, without complicated authentication processes slowing them down

About idenprotect
idenprotect is the first all-in-one password-free authentication, single sign-on and identity platform for organisations. Leading organisations use idenprotect to improve security, meet regulatory mandates and reduce complexity and costs. It eliminates the hacker's #1 target—the password—to protect against fraud, phishing and credential theft, it makes employee access and customer payments and transactions more secure. It can be deployed quickly and promises a much better user experience

Technical Specifications

idenprotect integrates with the leading virtual private networks (VPNs), security gateways and cloud apps. For maximum convenience, idenprotect supports alternative authentication methods when users are offline or don't have their phone, or when an app requires a different level of authentication. In addition, organisations can set up access rules, restricting access to specific countries and user groups.

Supported Platforms
iOS 10 or later, Android 6.0 or later, Windows 10, Linux (CentOS/Red Hat), MacOS 10

Integration Methods
SAML 2.0, RADIUS, Certificate-Based Authentication, Forms-Based Authentication, Time-Based OTP, Message-Based OTP (SMS)

OTP Security Algorithms
HMAC-SHA256

SDK Availability
iOS, Android and Windows

Deployment Options
On premises, cloud or as a hybrid

The future is password-free

We'd love to show you how idenprotect can give your organisation the security and simplicity it needs.
